

ICTS - EXPLOSIVES, DRUGS & CANINE OLFACTION SEARCH SERVICES

ICTS offer clients a range of complementary canine detection services. Our expertise can help you to ensure that your assets and premises are secured against drug or explosives infiltration. ICTS also offers the delivery of a valuable resource directly in support of Police operations.

Our dogs and handlers (Search Advisors) are trained and certified to the highest standards having attended, trained and passed out at Home Office ACPO recognised Police Dog Regional Training Schools. Furthermore, all of our Search Advisors are CRB cleared to enhanced level for working in schools, colleges and universities and are managed by licensed former Police Dog Section personnel. All of our services are delivered to ACPO standards and terms of reference.

DRUGS SEARCH

The link between organised crime, terrorism and drugs is now fully acknowledged. ICTS offers a proactive solution to counter drug activity in and around licensed premises, at events, in business premises, schools and universities, working with clients to create safer environments.

The deployment of drug detection dogs both proactive (buildings, areas and vehicles) and passive (for screening of people) offers clients a high profile solution to drug misuse. Working in partnership with Drug Action Teams, Town Centre Safety Managers, HR Departments and Police Authorities.

TRADITIONAL EXPLOSIVES SEARCH

In response to the ever increasing threat of terrorism, ICTS provides traditional explosive search services through the deployment of highly trained search advisors aided by explosive detection dogs. This type of deployment is a tried, trusted and proven method of locating explosives in a wide range of environments, from vehicle screening to systematic building searches.

Explosives search teams are available as a complementary measure to existing security services providing a high profile deterrent and delivering reassurance to staff, visitors, customers and the general public operating in shopping malls, sporting venues, iconic targets and transport hubs.

RASCargO

RASCargO is a fusion of low & high tech solutions which utilises specially trained search dogs to remotely detect explosives. It was developed in partnership with Department for Transport (DfT) in collaboration with defence scientists at the Defence Science and Technology Laboratory (Dstl). The technique enables the screening of oversized or dense cargo that cannot readily be subjected to current available screening methods. Air samples are collected from freight using special filters which are then presented to the trained dogs in a safe and controlled analysis screening station for the identification of the presence of the target scents.

Recognising the potential and in response to increased demand for the service ICTS has recently established a research and development centre in Oxfordshire which includes additional operational screening stations to support further development of their services at other airports throughout the UK.

This system is also available through partnership development projects with clients at international airports and marine ports.
